(Received: December 18, 2000)

SUMMARY: Electron-, proton-, and ionized helium-impact broadening parameter tables for In II spectral lines, are presented as a function of the temperature and the perturber density. Calculations have been performed within the semiclassical perturbation approach.

1. INTRODUCTION

With the development of space technology and satellite born astronomical instruments astrophysical interest for data on trace element spectral lines increases.

In order to continue our efforts to provide to astrophysicists and plasma physicists Stark broadening data needed for the consideration and modeling of astrophysical and laboratory plasmas as well as laser produced and fusion plasmas, we have calculated within the semiclassical-perturbation formalism (Sahal-Bréchet, 1969ab, see also Sahal-Bréchet, 1974, Fleurier *et al.* 1977, Dimitrijević and Sahal-Bréchet, 1984, Dimitrijević *et al.* 1991, Dimitrijević and Sahal-Bréchet, 1995) electron-, proton-, and He II-impact line widths and shifts for 145 In II multiplets. The used formalism has been reviewed briefly in Dimitrijević and Sahal-Bréchet, 1995.

2. RESULTS AND DISCUSSION

All relevant details concerning the obtained results and the calculation procedure, as well as the comparison with experimental (N'Dollo and Fabry, 1987) and other theoretical data (N'Dollo and Fabry, 1987, Lakićević, 1983) will be published in Dimitrijević and Sahal-Bréchet, 2001. Here, we present only tables of Stark broadening parameters. Atomic energy levels needed for calculations have been taken from Moore (1971). Our results for 145 In II multiplets are shown in Table 1, for perturber densities $10^{13} - 10^{15} \text{ cm}^{-3}$ and $10^{17} - 10^{19} \text{ cm}^{-3}$ respectively. The temperature range is $T = 5\,000 - 100\,000 \text{ K}$. Stark broadening parameters for densities lower than tabulated, are linear with perturber density. We also specify a parameter C (Dimitrijević and Sahal-Bréchet 1984), which gives an estimate for the maximum perturber density for which the line may be treated

Table 1. This Table shows electron-, proton-, and He II-impact broadening parameters for In II for perturber densities of $10^{13} - 10^{15} \text{ cm}^{-3}$ and $10^{17} - 10^{19} \text{ cm}^{-3}$ and temperatures from 5 000 up to 100 000 K. Stark broadening parameters for densities lower than for tabulated values, are linear with perturber density. Transitions and averaged wavelengths for the multiplet (in Å) are also given. By dividing C by the corresponding full width at half maximum (Dimitrijević *et al.*, 1991), we obtain an estimate for the maximum perturber density for which the line may be treated as isolated and tabulated data may be used. The asterisk identifies cases for which the collision volume multiplied by the perturber density (the condition for validity of the impact approximation) lies between 0.1 and 0.5.

as isolated when divided by the corresponding full width at half maximum. For each value given in Table 1, the collision volume (V) multiplied by the perturber density (N) is much less than one and the impact approximation is valid (Sahal-Bréchet, 1969ab). Values for $NV > 0.5$ are not given and values for $0.1 < NV \leq 0.5$ are denoted by an asterisk. Stark broadening parameters for densities lower than tabulated, are linear with perturber density. When the impact approximation is not valid, the ion broadening contribution may be estimated by using quasistatic approach (Sahal-Bréchet 1991 or Griem 1974). In the region between where neither of these two approximations is valid, a unified type theory should be used. For example in Barnard *et al.* (1974), a simple analytical formula for such a case is given. The accuracy of the results obtained decreases when broadening by ion interactions becomes important.

The discussion of obtained results as well as Stark broadening data for perturber density of 10^{16} cm^{-3} will be published in Dimitrijević and Sahal-Bréchet (2001).
