(Received: July 14, 2001)

SUMMARY: Electron-, proton-, and ionized helium-impact broadening parameter tables for 101 In II multiplets, are presented as a function of temperature for the perturber density of 10^{16} cm^{-3} . Calculations have been performed within the semiclassical perturbation approach.

1. INTRODUCTION

Recently (Dimitrijević and Sahal–Bréchet, 2001a), we have published electron-, proton-, and He II impact line widths (full width at half maximum) and shifts for 145 In II multiplets for perturber densities of $10^{13} - 10^{15} \text{ cm}^{-3}$ and $10^{17} - 10^{19} \text{ cm}^{-3}$ and temperatures $T = 5000 \text{ K}, 10000 \text{ K}, 20000 \text{ K}, 30000 \text{ K}, 50000 \text{ K}$ and 100000 K . Calculations have been performed within the semiclassical-perturbation formalism (Sahal–Bréchet, 1969ab, see also Sahal–Bréchet, 1974, Fleurier *et al.*, 1977, Dimitrijević and Sahal–Bréchet, 1984, Dimitrijević *et al.* 1991, Dimitrijević and Sahal–Bréchet, 1995) In order to complete our results, here will be presented the data for the perturber density of 10^{17} cm^{-3} and for the same temperatures as in Dimitrijević and Sahal–Bréchet (2001a).

2. RESULTS AND DISCUSSION

All relevant details concerning the obtained results and the calculation procedure, as well as the discussion of the obtained results and comparison with experimental (N'Dollo and Fabry, 1987) and other theoretical data (N'Dollo and Fabry, 1987, Lakićević, 1983) will be published in Dimitrijević and Sahal–Bréchet, 2001b. Here, we present only tables of Stark broadening parameters. Atomic energy levels needed for calculations have been taken from Moore (1971). Our results for 101 In II multiplets are shown in Table 1, for perturber density of 10^{16} cm^{-3} . The temperature range is $T = 5000 - 100000 \text{ K}$. We also specify a parameter C (Dimitrijević and Sahal–Bréchet 1984), which gives an estimate for the maximum perturber density for which the line may be treated as isolated when divided by the

Table 1. This Table shows electron-, proton-, and He II- impact broadening parameters for In II for perturber density of 10^{16}cm^{-3} and temperatures from 5 000 up to 100 000 K. Transitions and averaged wavelengths for the multiplet (in Å) are also given. By dividing C by the corresponding full width at half maximum (Dimitrijević *et al.*, 1991), we obtain an estimate for the maximum perturber density for which the line may be treated as isolated and tabulated data may be used. The asterisk identifies cases for which the collision volume multiplied by the perturber density (the condition for validity of the impact approximation) lies between 0.1 and 0.5.

corresponding full width at half maximum. For each value given in Table 1, the collision volume (V) multiplied by the perturber density (N) is much less than one and the impact approximation is valid (Sahal-Bréchet, 1969ab). Values for $NV > 0.5$ are not given and values for $0.1 < NV \leq 0.5$ are denoted by an asterisk. When the impact approximation is not valid, the ion broadening contribution may be estimated by using quasistatic approach (Sahal-Bréchet 1991 or Griem 1974). In the region between where neither of these two approximations is valid, a unified type theory should be used. For example in Barnard *et al.* (1974), a simple analytical formula for such a case is given. The accuracy of the results obtained decreases when broadening by ion interactions becomes important.
