(Received: June 10, 2002)

SUMMARY: Using a semiclassical approach, we have calculated electron–, proton–, and He II–impact line widths and shifts for 52 Be III multiplets as a function of temperature and perturber density. The electron temperatures are 10,000 K; 20,000 K; 50,000 K; 100,000 K 200,000K and 300,000 K and perturber densities are from 10^{11} cm^{-3} up to 10^{21} cm^{-3} .

1. INTRODUCTION

The astrophysical importance of Be III spectral lines for the abundance investigations, nucleosynthesis considerations and laboratory and astrophysical plasma diagnostics has been considered in Dimitrijević and Sahal-Bréchot (1996ab). In the above mentioned Refs. Stark broadening parameters of 12 Be II spectral lines have been obtained within the semiclassical perturbation approach (Sahal-Bréchot 1969ab, see also Sahal-Bréchot 1974, Fleurier, Sahal-Bréchot and Chapelle 1977, Dimitrijević and Sahal-Bréchot 1984, Dimitrijević, Sahal-Bréchot and Bommier 1991, Dimitrijević and Sahal-Bréchot 1995a). However, the recently published analysis of the spectrum and term system of Be III (Jupén *et al.* 2001) enables the calculation of Stark broadening parameters for 52 additional multiplets, with the standard accuracy. The aim of this work is to determine these additional parameters in order to extend the set of available Stark broadening data.

2. RESULTS AND DISCUSSION

The used formalism has been reviewed briefly *e.g* in Dimitrijević and Sahal-Bréchot (1995ab). All relevant details concerning the obtained results and the calculation procedure will be published in Dimitrijević *et al.* 2003). Here, we present only tables of Stark broadening parameters. Atomic energy levels needed for calculations, have been taken from Jupén *et al.* (2001). The results for 52 Be III multiplets, for Stark broadening due to electron–, proton–, and ionized helium–impacts are shown in Table 1 for perturber densities $10^{11} \text{ cm}^{-3} – 10^{21} \text{ cm}^{-3}$ and temperatures from 10,000 up to 300,000 K. Stark broadening parameters for densities lower than for tabulated values, are linear with perturber density. We also specify a parameter C (Dimitrijević and Sahal-Bréchot 1984), which gives an estimate for the maximum perturber density for which the line may be treated as isolated, when it is divided by the corresponding full width at half maximum. For each value given

Table 1. This table shows electron-, proton-, and He II-impact broadening parameters for Be III for perturber densities $10^{11} \text{ cm}^{-3} - 10^{21} \text{ cm}^{-3}$ and temperatures from 10,000 up to 300,000 K. Stark broadening parameters for densities lower than tabulated values, are linear with perturber density. Transitions and averaged wavelengths for the multiplet (in Å) are also given in the Table. By dividing C by the corresponding full width at half maximum (Dimitrijević, Sahal-Bréchot and Bommier 1991), we obtain an estimate for the maximum perturber density for which the line may be treated as isolated and tabulated data may be used. The asterisk identifies cases for which the collision volume multiplied by the perturber density (the condition for the validity of the impact approximation lies between 0.1 and 0.5.

in Table 1, the collision volume (V) multiplied by the perturber density (N) is much less than one and the impact approximation is valid (Sahal-Bréchot, 1969ab). Values for $NV > 0.5$ are not given and values for $0.1 < NV \leq 0.5$ are denoted by an asterisk. When the impact approximation is not valid, the ion broadening contribution may be estimated by using quasistatic approach (Sahal-Bréchot 1991 or Griem 1974). In the region between where neither of these two approximations is valid, a unified type theory should be used. For example in Barnard, Cooper and Smith (1974), a simple analytical formula for such a case is given. The accuracy of the results obtained decreases when broadening by ion interactions becomes important.

The discussion of obtained results will be given in Dimitrijević *et al.* (2003).

Претходно саопштење

Користећи семикласичан прилаз, израчунате су ширине и помераји спектралних линија, проузроковани сударима са електронима,

протонима и јонима хелијума, за 52 мултиплета Be III. Резултати су дати у функцији температуре и концентрације пертурбера.
